

# Do weather changes matter?

Marc Los Huertos

July 8, 2016

## 1 Introduction

According to the IPCC, the temperature has been changing about 0.X degrees per XX years – but how do these changes “map” onto a community that you care about? Can we find out how these changes will affect specific communities we care about? In other words, do weather changes matter?

### 1.1 Project Description

### 1.2 Driving Question(s)

Projects can often be structured as questions, but sometimes it is worth phrasing the questions in a number of ways – this might help you find ways that you might find the question more provocative and interesting. For example,

- Is my region’s climate changing?
- How is climate change affecting my community?

But you can modify these questions to develop the project that you might find compelling.

In addition, we may develop “sub-questions” that can be developed or answered as chunks, which will be used to answer the main question or questions. For example,

- Are there biases in weather data? Can these biases be corrected? If so, how?
- How can we evaluate trends? What are the most appropriate statistical tools to test for trends?
- What is the best way to display visual data? Are there best practices to guide a public product to make it more compelling or interactive?

### 1.3 Public Product

Science is a social project. From the questions we ask, to the results and their presentation, science is embedded in a culture of norms. Thus, as part of this project, students will produce a narrative blog with the following characteristics:

- Appropriate and thoughtful statistical analysis;
- Professionally appearing and interactive graphics; and
- Narrative that describe the climate and climate implications to the region.

### 1.4 Goals of this Document

1. Describe the goals and approach for the project;
2. Provide or point to resources to prepare for and conduct the project; and
3. Describe how we will evaluate the project process and products.

### 1.5 Learning Goals

For this project, you will use weather data to the question "do weather changes matter". How you answer the question is largely up to you, however, there are some learning goals associated with this project:

- Learn how to download and process weather data;
- Evaluate the trends in weather data;
- Determine the impact of weather in a human or non-human community; and
- Communicate your conclusions to the public.

Throughout this project, your team and instructor will develop the strategies and skills to address this question and help you make some conclusions and present the results to the public.

## 2 Approach

Students will have the following tools available.

- NOAA website where data can be downloaded;
- R Studio Server with some scripts to help you develop analyses;
- Github to store project codes; and
- Shiny app templates that might be used as a container for interactive content.

## **2.1 Expert Groups**

# **3 Project Stages (i.e. Scaffolding)**

## **3.1 Session 1: How are temperature data collected?**

Research how climate data are collected?

Create a wiki that describe how data are collected for the following categories

- Land-based Temperatures
- Sea surface Temperatures
- Satellite Collected

## **3.2 Session 2: How are the data store, curated and checked for quality?**

Watch this video

Write a wiki that describes:

1. How as data storage changed in the last 100 years;
2. how data are curated;
3. how are data checked for quality

## **3.3 Session 3: Data Sources and Importation**

Each team will research and evaluate various sources of data.

### **3.3.1 Sources of Data**

Students will create a Wiki that describes the each data set, it sources and how it might become usable using open sources of software.

### **3.3.2 File Types and Software Tools**

## **3.4 Session 4: Obtaining and Analyzing Data**

### **3.4.1 Why R, Why Rstudio, and Why Open Source?**

Excel was not designed to handle large datasets, i.e. over 1 million rows. For most purposes, this might be enough. However, in many climate science data often exceed this number of samples.

## 4 Project Stages

1. Download data (easier) or create a link to a database (preferred);
2. Pre-process data (uncompress, remove headers, etc.);
3. Import data into open source software programs;
4. Process data (converting values to NA, naming variables, reshaping data);
5. Analyze data for patterns (e.g. trends);
6. Create compelling graphics (easier); or an interactive shiny app (preferred).
7. Write blog to describe results
8. Search peer reviewed articles to evaluate ecological, economic, and sociological implications of climate patterns.

## 5 Computing Resources

### 5.1 R Programming Language

### 5.2 RStudio and Github

### 5.3 R libraries

For this code, I suggest the using the R base package plus some libraries for assorted specialized tools. When these are used, I can explain them, but for now, I suggest you make sure these files are 1) convenient and 2) useful.

For example, here is a list of useful library packages that might be helpful:

**tidyr ...**

**dplyr**

**stringr**

**reshape2**

**??**

### 5.4 Customized Functions

We will also use a customized function, which can be called automatically if you have the source code in your directory with the following:

**summarySE.R** Can be downloaded...

Or you can download this file from <http://...> and run code to create the function manually.

## 6 Evaluating Narratives

### 6.1 Examples

### 6.2 Developing Criteria for Project Models

### 6.3

### 6.4
